SUBJECT: 2007 Klamath River Pathogen Monitoring

As a component of Klamath River fish health assessment the California-Nevada Fish Health Center is examining juvenile Klamath River Chinook Salmon to monitor the incidence of *Ceratomyxa shasta* and *Parvicapsula minibicornis* infection. Fish are collected by biologists with the Karuk Tribe, Yurok Tribe, Hoopa Tribe and US Fish and Wildlife Service. The fish health center is providing laboratory support for the project. Sampling began the week of April 15, 2007 and will continue into mid-August.

The *Ceratomyxa shasta* QPCR assay has been completed for Chinook collected in weeks 1-7 (April 15 – June 2), and *Cs* was detected in 13% (39/305) of Chinook tested. The *Parvicapsula minibicornis* QPCR assay has been completed for Chinook collected in weeks 1-3 (April 15 – May 5), and *Pm* was detected in 73% (51/70) Chinook tested. The next update of this data will be available after June 25.

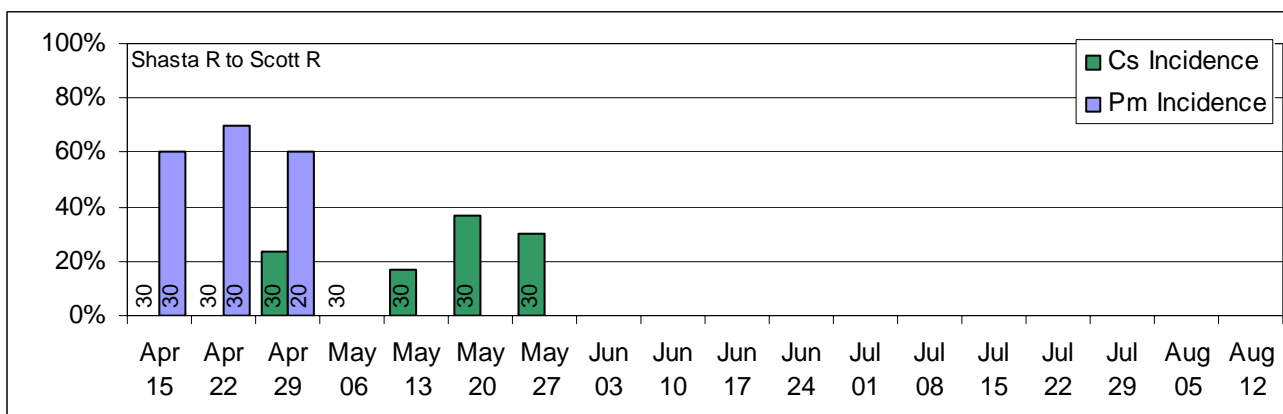

Figure 1. Incidence of *Ceratomyxa shasta* and *Parvicapsula minibicornis* infection in juvenile Klamath River Chinook Salmon captured in the Shasta to Scott River Reach. Number of fish assayed for each pathogen is indicated at the base of each bar. Assays for *Cs* were completed through May 27, while *Pm* assays were completed through Apr 29.

Table 1. Incidence of *Ceratomyxa shasta* in Chinook salmon by Quantitative Polymerase Chain Reaction (QPCR). All data is preliminary and subject to revision.
